

ORB + ICT Session Liquidity Framework

Five-page quick manual | Pine Script v6

Purpose A clean, confirmed-bar observation framework for major sessions, one selected opening range, directional validation, and setup sequencing. It does not place trades.

First use

1. Select a 5-minute or 15-minute standard candle chart.
2. Leave Display mode on Minimal.
3. Choose the relevant ORB, or leave ORB session on Auto.
4. Observe Upcoming, Forming, and Closed.
5. Wait for confirmed validation stages; a score cannot skip the sequence.
6. Treat outputs as analytical observations, not trade instructions.

Install

Open TradingView > Pine Editor, create a new indicator, replace the sample with the delivered .pine source, and choose Add to chart. The delivered source compiled successfully in TradingView Pine v6 on 20 August 2026.

Core rule Bias is evidence balance. Setup score is confluence quality. Neither is a probability, win rate, confidence percentage, or recommendation.

1. Modes and essential settings

Mode	What appears
Minimal	Light Asian/London/New York boxes, one selected ORB, close icon, short high/low segments, compact dashboard.
Standard	The same clean framework with slightly stronger session and ORB fills.
Analysis	Allows opted-in Imbalances, Equal highs/lows, and previous-day/week levels under a strict zone budget.
Custom	Allows Advanced technical layers and the optional provisional last-bar label.

The 40 controls, grouped

- General: mode, trading-day retention, display timezone, dashboard, and preferred-session mode/override.
- Sessions: show boxes; enable, time, IANA timezone, and color/transparency for Asian, London, and New York.
- Opening Range: Auto/Asian/London/New York, duration, box, midpoint, and close marker.
- Validation: Standard/Strict, confirmed-bars setting, confirmed markers, and developing labels.
- Advanced: optional technical layers, zone budget, alerts, minimum break distance, bias alignment, and disabled-by-default custom session.

Session defaults

Session	Default	Timezone
Asian	00:00-08:00	Europe/London
London	08:00-16:00	Europe/London
New York	08:00-17:00	America/New_York
Custom	06:00-10:00; off	Exchange

Timezone note Named IANA zones handle daylight-saving changes. Display timezone controls the dashboard clock and retention day key; it does not replace each session's timezone.

2. ORB lifecycle

State	Meaning
Upcoming	The selected session's current-day ORB has not started.
Forming	High and low update from constituent chart bars.
Closed	The final constituent candle confirms; range values freeze permanently.
Break observed	A confirmed close clears the frozen range by the minimum distance and passes Strong move qualification.
Retest	A later confirmed candle retests the broken boundary and closes on the breakout side.
Confirmed	A later confirmed continuation close clears the retest candle's directional extreme.

What freezes and what extends

- One diamond is created on the confirmed ORB-completing candle and never moves.
- The compact ORB box ends at the ORB deadline.
- Only ORB high and low continue after closure, and both stop at session close.
- The midpoint is off by default; no session OHLC or full-chart background is drawn.

Standard vs Strict

Check	Standard	Strict
Strong move	0.75 ATR body; 50% body share	1.0 ATR body; 60% body share
Reversal	Confirmed reclaim plus direction	Also clears the preceding bar extreme
Retest	Boundary touch and close beyond	Also rejection wick or engulfing evidence
Continuation	Clears retest extreme	Also passes Strong move again

3. Bias, stage, and quality

Bullish evidence and bearish evidence are accumulated separately. Net bias equals bullish evidence minus bearish evidence.

Net	Classification	Evidence sources
+5 or more	Strong Bullish	Daily open; completed 1H/4H structure; day/Asian sweeps; Imbalance reaction; qualified ORB break
+2 to +4	Bullish	Same components, weighted independently
-1 to +1	Neutral	Bullish and bearish evidence broadly balanced
-2 to -4	Bearish	Same components, weighted independently
-5 or less	Strong Bearish	Bearish evidence exceeds bullish evidence by five or more

Mandatory sequence sweep -> reclaim/reversal -> ORB break -> retest/rejection -> continuation

Quality component	Points
Sweep; reclaim/reversal; aligned bias	2 + 2 + 2
ORB break; Strong move; breakout Imbalance	1 + 2 + 1
Retest/rejection; continuation	2 + 2
Target space $\geq 2R$; active selected session	1 + 1

Maximum: 16. Labels: Developing 5+, Good 8+, High 11+. A high score never creates a confirmed marker without the full mandatory sequence.

Preferred-session Auto mapping

- EUR/GBP/CHF forex -> London; other JPY/AUD/NZD forex -> Asian; crypto -> Asian; everything else -> New York.
- Ticker root plus ticker text reduces broker prefix/suffix problems. Manual mode overrides unsupported symbols.

4. Retention, alerts, and guarantees

Trading-day retention

Trading days = 3 keeps the current chart day plus the two immediately preceding days that contain bars. Every drawing carries a stable display-timezone day key. Missing market days are skipped. Separate internal safety caps protect TradingView drawing limits.

One-shot alerts

- ORB closed; confirmed ORB break; retest/rejection confirmed; final setup confirmed.
- Dynamic alerts include symbol, session, direction where relevant, setup score, and net bias.

Non-repainting checklist

- Permanent states, the ORB-close icon, and confirmed setup markers require `barstate.isconfirmed`.
- ORB high/low stop changing immediately after confirmed closure.
- Completed 1H/4H values use source offsets; previous-day/week levels use completed periods.
- Equal highs/lows use confirmed pivots after right-side bars have elapsed.
- No negative history offset, future bar index, or unconfirmed higher-timeframe high/low is used.
- Only the optional PROVISIONAL last-bar label may move intrabar.

Unavoidable limitations

- A chart bar is indivisible. A 5-minute ORB on a 15-minute chart uses the first 15-minute candle; use a timeframe no larger than the ORB duration.
- Standard candles are required for literal OHLC; synthetic candles change all supplied prices.
- Target space is structural geometry, not spread, slippage, execution, or probability.

Final reminder Observe first, verify the symbol/feed/session alignment, and keep Confirmed bars only enabled for normal use.
